

AMENDMENTS TO THE SPECIFICATION

In the Specification

Please **AMEND** Paragraph 0054 as follows:

If the number of the conductive particles 230a interposed between the gate pads 220 and the leads 133a after heat press, which is called a dent number, is uniform for each pair of the gate pads 220 and the leads 133a, it is considered that the bonding of the gate pads 220 and the leads 133a is ~~successive~~ successful and thus a defect of the connection therebetween may not be generated.
